GROUND BEAMS

Precast concrete ground beams form a permanent shutter around the perimeter of your building to simplify the pouring of concrete floors. They're a great alternative to blockwork foundations, making construction quicker and easier.

- ✓ Fast track construction
- ✓ Site-Specific Designs
- ✓ 20kN/m2 Surcharge Capacity
- ✓ C50 Concrete Mix Strength
- ✓ Offsite Manufacturing

Our contracts division provide a design consultancy service, precast installation & construction services for all our products. Call the team today to find out more and discuss your project on 01158 957510

Features

The beams are designed to span between steel columns or concrete pad foundations, and sit directly on top of the pad foundations so no additional support is required under the units.

The beams are manufactured in two profiles, with a toe, so the units will be self-supporting when installed, sometimes called boot-beams or as flat panels. The thickness of the beam can be altered to suit loadings and chamfers cast in the top edge.

All of our precast ground beams are designed and manufactured to individual project specifications & dimensions.

We have a technical team on hand who can review drawings and dimensions prior to quotation to make sure you have everything you need.

Handling & Installation

Precast ground beams are installed using a pin anchor lifting point and clutch shackles. The lifting & fixing systems of our precast products have been designed for speed of installation, ease of use and with the safety of the installer in mind.

Whilst our products are relatively straightforward to install, we do offer a full precast installation service for your convenience. Speak to the team today for a free installation quotation for your project – 01158 957510.

Get clarity.

Get to grips with each product in detailed 3D.
