Features

A typical terrace will include walkways for spectator movement, balcony walls, and various other units for areas such as disabled access and seating.

Units generally span between beams with up to 8m span and are normally “L” or “T” shaped in sections with varying rise heights and goings.

For safe movement of spectators up and down the terrace, the rise between precast terrace units needs to be about 175mm - step blocks are provided which sit on the units to achieve this.

All of our precast stadium terracing and seating units are made to order, therefore dimensions are individual to the client.

We have a technical team on hand who can review drawings and dimensions prior to quotation to make sure you have everything you need.

Handling & Installation

Precast terracing and seating units are installed using proprietary lifting anchors, which are cast into the concrete units. The lifting & fixing systems of our precast products have been designed for speed of installation, ease of use and with the safety of the installer in mind.

Whilst our products are relatively straightforward to install, we do offer a full precast installation service for your convenience. Speak to the team today for a free installation quotation for your project – 01158 957510.
